

Assignment 1.3 Feature Branch Workflow Simulation

Alika Hanekom

5/6/2026

Explanation of the conflict resolution strategy.

The merging conflict occurred because the feature branches modified the same section of code, the version number, and a part of the main execution block in the main.py file. The multiply branch, auto merged, but when merging the divide branch into main, conflict was detected in the version difference, 1.1.0 and 1.0.1. The feature/multiply-function updated the version to 1.1.0, and the feature/divide-function updated the version to 1.0.1. Git was therefore not able to automatically reconcile the differences.

Instead of choosing one set of changes, I combined the changes by keeping the multiply and divide implementation. I reviewed the conflict within GitHub, and changed the version number to 1.2.0, both in the comment and in the print ("Calculator v1.2.0"). I then removed the conflict markers and ensured the divide and multiply functions were correctly included in the final file.

I synchronised my local repository with the remote repository to ensure consistency. I had to reset my local branch to match the main branch. I also verified that all the functions (add, subtract, divide, multiply) executed correctly in the main section. I then staged the resolved file and committed the changes with a descriptive message.
